FUEL FILTERS

Engines require clean fuel to operate properly. **Fuel filters** help to remove dirt and other contaminants from the fuel before supplying it to the engine. Resulting in excellent engine performance and long life.

FUEL FILTER IS A VERY IMPORTANT PART OF YOUR VEHICLE

When refueling during ordinary use of the car, fine dirt may enter the fuel tank when opening and closing the fuel cap and this can build up within the fuel filter, and cause it to become blocked.

The fuel filter must be replaced regularly following the recommended maintenance schedule.

FUEL FILTERS

Why is it important to use Honda Genuine Fuel Filters?

The suction filter removes large dirt, and the fuel is then sucked into the fuel pump. The fuel is then filtered again by the fuel filter before passing through the fuel pipe and being fed to the engine fuel injectors.

If the fuel filter becomes blocked, the amount of fuel sprayed by the fuel injectors decreases, or they may not spray at all.

When this happens, the engine may experience conditions similar to when the car runs out of fuel resulting in poor engine performance or acceleration, engine stalls and difficulty starting the engine.
