

## WIPERS

**Wipers** are a simple but important part of your vehicle's comfort and safety. The rubber of wiper blades gradually deteriorates due to usage conditions, temperature changes, sunlight or acid rain. This increases frictional resistance where rubber is in direct contact with the glass, causing juddering.

### **HONDA'S ADVICE : WIPER RUBBER AND WIPER BLADES MUST BE REPLACED UNDER THE FOLLOWING CONDITIONS**

- The rubber jumps when operating the wipers (called juddering). Juddering may also occur if the wiper blades are bent or the glass surface is dirty.
- Streaks on the glass surface when operating the wipers. If dirt has adhered to the blade rubber or deterioration has occurred to form cracks, the wiping efficiency may reduce partially, leaving streaks on the glass surface.
- Smearing of the glass surface when operating the wipers (smearing). Oil or other contaminants on the wiper rubber can cause smearing on the glass surface, distorting visibility.

## WIPERS

Poor operation

Persistently misty windshield

Noisy or jerky movement

Streaky windshield

### VISIBILITY IS PART OF YOUR SAFETY

When wiper rubber wipes away ordinary raindrops, they leave a uniform film to ensure a safe level of visibility. Yet when oil containing exhaust gas from surrounding cars (in particular diesel trucks), wax or similar substances adhere to the glass surface, parts of the rubber also adheres to the glass surface, resulting in an uneven film being generated and distorted visibility. If visibility is distorted, check the rubber, and clean or replace them at your Authorised Honda dealer.

## Why is it important to use Honda Genuine Wipers ?

Honda Genuine Wiper Blade Rubber has been developed to suit the front glass curvature of Honda cars, and this ideal shape provides the **best wiping performance**.
